Biology 9  

Name__________________________

**Fetal Pig Dissection Manual & Worksheets**

**Background:**
Mammals are vertebrates having *hair* on their body and *mammary glands* to nourish their young. The majority are *placental mammals* in which the developing young, or *fetus*, grows inside the female's *uterus* while attached to a membrane called the *placenta*. The placenta is the source of food and oxygen for the fetus, and it also serves to get rid of fetal wastes. The dissection of the fetal pig in the laboratory is important because pigs and humans have the same level of metabolism and have similar organs and systems. Also, fetal pigs are a byproduct of the pork food industry so they aren't raised for dissection purposes, and they are relatively inexpensive.

**Objectives:**
Identify important external structures of the fetal pig.
Identify major structures and functions associated with a fetal pig's digestive, respiratory, circulatory, and systems.

**Materials:**
preserved fetal pig, dissecting pan, dissecting kit, dissecting pins, string, plastic bag, metric ruler, paper towels, vinyl gloves, safety glasses

**Part 1 - External Anatomy (See Part 1 Worksheet)**
1. Obtain a fetal pig and rinse off the excess preservative by holding it under running water. Lay the pig on its side in the dissecting pan and locate dorsal, ventral, & lateral surfaces. Also locate the anterior and posterior ends. Label the head, neck, thorax, abdomen, and tail.

A fetal pig has not been born yet, but its approximate age since conception can be estimated by measuring its length from tip of snout to base of tail. Record the length and the approximate age.

- 11mm – 21 days
- 17 mm – 35 days
- 2.8 cm – 49 days
- 4 cm – 56 days
- 22 cm – 100 days
- 30 cm -- birth

2. Examine the pig's head. Locate the eyelids and the external ears or *pinnae*. Find the external nostrils called *nares*. Label on diagram.

3. Locate the eye lids and part them using the probe. Many mammals have a 3<sup>rd</sup> eye lid called the *nictitating membrane*. Humans have a vestigial 3<sup>rd</sup> eye lid called the *plica semilunaris*.

4. Study the pig's appendages and examine the pig's toes. Count and record the number of toes and the type of hoof the pig has.

5. Locate the *umbilical cord*. Label it on the diagram. With scissors, cut across the cord about 1 cm from the body. Examine the 3 openings in the umbilical cord. The largest is the umbilical vein, which carries blood from the placenta to the fetus. The two smaller openings are the umbilical arteries which carry blood from the fetus to the placenta.

6. Lift the pig's tail to find the anus. Study the ventral surface of the pig and note the tiny bumps called *mammary papillary*. These are present in both sexes. In the female these structures connect to the mammary glands.

7. Determine the sex of your pig by locating the urogenital opening through which liquid wastes and reproductive cells pass. In the male, the opening is on the ventral surface of the pig just posterior to the umbilical cord. In the female, the opening is ventral to the anus. Record the sex of your pig.
8. Carefully lay the pig on one side in your dissecting pan and cut away the skin from the side of the face and upper neck to expose the masseter muscle that works the jaw, lymph nodes, and salivary glands. Label these on your hand-in.
9. With scissors, make a 3-cm incision in each corner of the pig's mouth. Your incision should extend posteriorly through the jaw.
10. Spread the jaws open and examine the tongue.
11. Observe the palate on the roof of the mouth. The anterior part of the palate is the hard palate, while the posterior part is the soft palate.
12. Locate the epiglottis, a cone-shaped structure at the back of the mouth. Above the epiglottis, find the round opening of the nasopharynx. This cavity carries air from the nostrils to the trachea, a large tube in the thoracic which supplies air to the lungs.
13. Dorsal to the glottis, find the opening to the esophagus. Examine the tongue and note tiny projections called sensory papillae.
14. Examine the teeth of the pig. Canine teeth are longer for tearing food, while incisor are shorter and used for biting. Pigs are omnivores, eating plants and animals.
15. Label the drawing of the inside of the pig's mouth.
16. Clean up your materials and work area. Wrap the pig in damp paper towels and put it in a zip-lock plastic bag. Label your bag with your names and the sex of your pig. Return your lab equipment and pig to the supply area and then thoroughly wash your hands with soap.

Part 2  Section A: The Incision
1. Be sure to wear your lab apron and eye cover. Obtain your dissecting equipment and pig from the supply cart.
2. Place the fetal pig ventral side up in the dissecting tray.
3. Tie a string or elastic band securely around a front limb. Run the string under the tray, pull it tight, and tie it to the other front limb. Repeat this procedure with the hind limbs to hold the legs apart so you can examine internal structures.
4. Study the diagram below. The dashed lines numbered 1-4 show the first set of incisions that you will make. To find the exact location for the incision marked 2, press along the thorax with your fingers to find the lower edge of the ribs. This is where you will make incision 2.
5. With scissors, make the incisions in order, beginning with 1. Be sure to keep the tips of your scissors pointed upward because a deep cut will destroy the organs below. Also, remember to cut away from yourself.
6. After you have made your incisions through the body wall (skin & muscle), you will see the peritoneum, a thin layer of tissue that lines the body cavity. Cut through the peritoneum along the incision lines.
7. Spread the flaps of the body wall apart. Cut the umbilical vein which extends through the liver.
8. Once the vein is cut, carefully pull the flap of skin, including the end of the umbilical cord between the hind legs. You are now able to see the organs of the abdominal cavity.
9. If time remains continue with part B, the digestive tract. Otherwise, clean up your materials and work area. Place your pig in a ziplock bag, wash and dry your tray and tools. And put them back on the supply bench. Thoroughly wash your hands with soap.
Section B: Digestive System
Be sure you are wearing your lab apron/old shirt and eye cover.

1. Locate the **diaphragm**, a sheet of muscle that separates the abdominal cavity from the thoracic cavity. Find the most obvious structure in the abdominal cavity, the brownish-colored **liver**. Count the number of lobes.

2. Find the tube-like **esophagus** which joins the mouth and the stomach. Food moves down the esophagus by muscular contractions after being softened by saliva in the mouth. Follow the esophagus and locate the soft, sac-like **stomach** beneath the liver.

3. With scissors, cut along the outer curve of the stomach. Open the stomach and note the texture of its inner walls. These ridges inside the stomach are called **rugae** and increase the area for the release of digestive enzymes. The stomach may not be empty because fetal pigs swallow amniotic fluid.

4. The pig has a digestive system which is classified as **monogastric** or **nonruminant**. Humans also have this type of digestive system. They have one stomach (mono=one, gastric=stomach). Locate the entrance to the stomach or esophageal area, the **cardiac region** which is largest, and the **pyloric region** where the stomach narrows to join to the **small intestine**.

5. At the end of the stomach, there is a **sphincter**, or ring-shaped muscle to control food leaving the stomach and entering the **duodenum**. Locate the cardiac sphincter at the junction of the stomach and esophagus, and the pyloric sphincter at the junction of the stomach and small intestine. Fetal pigs receive their nourishment from their mother through the umbilical cord.

6. Identify the first part of the small intestine, the U-shaped duodenum, which connects to the lower end of the stomach. Pancreatic juice (made by the **pancreas**), and bile (made by the liver and stored in the **gall bladder**), are added to food here to continue digestion.

7. Study the rest of the small intestine. Notice that it is a coiled, narrow tube, held together by tissue called **mesentery**. The soupy, partly digested food that enters the small intestine from the stomach is called **chyme**.

8. Carefully cut through the mesentery and uncoil the small intestine. Note and record its length in centimeters. The mid-section is called the **jejunum**, while the last section is called the **ileum**.

9. With scissors, remove a 3-cm piece of the lower small intestine. Cut it open and rinse it out.

10. Observe the inner surface of the small intestine. Run your finger along it and note its texture. Using a magnifying glass, examine the **villi**, the tiny projections that line the small intestine and increase the surface area for absorption.

11. Follow the small intestine until it reaches the wider, looped **large intestine**. Cut the mesentery and unwind the large intestine or **colon**. Measure and record its length.

12. At the junction of the large and small intestine, locate a blind pouch called the **caecum**. The caecum has no known function in the pig.

13. Notice that the large intestine leads into the **rectum**, a tube that runs posteriorly along the dorsal body wall. The rectum carries wastes to the opening called the **anus** where they are eliminated.

14. Locate the thin, white **pancreas** beneath the stomach and duodenum. Pancreatic juice flows through pancreatic ducts to the duodenum.

15. Between the lobes of the liver, find the small, greenish-brown **gall bladder**. Locate the hepatic duct which carries bile from the liver to the gall bladder.

16. Find the **spleen**, a long, reddish-brown organ wrapped around the stomach. The spleen filters out old red blood cells and produces new ones for the fetus.

17. On the diagram on the back of day 2 hand-in, label the pig’s body organs.

18. **Clean up your materials and work area.** Place your pig in a ziplock bag, wash and dry your tray and tools. And put them back on the supply bench. Thoroughly wash your hands with soap.

Part 3  Respiratory System
Biology 9

Name___________________________

Be sure to wear your lab apron and eye cover.
1. Examine the diaphragm, a sheet of muscle that stretches across the abdominal cavity and separates it from the thoracic cavity where the lungs are located. The diaphragm isn't used by the fetal pig because gas exchange occurs through the umbilical cord. The diaphragm in adult pigs moves up and down changing air pressure in the chest cavity causing air to move into and out of the lungs.
2. In order to see the upper part of the respiratory system, you will need to extend cut #1 up under the pig's throat and make to more lateral incisions in order to fold back the flaps of skin covering the throat.
3. In the thoracic cavity, carefully separate the pericardium or sac surrounding the heart and the diaphragm from the body wall.
4. Locate the two, spongy lungs that surround the heart. The tissue that covers and protects the lungs is called pleura. The lungs haven't been used by the fetus so they have never contained air.
5. Find the trachea, a large air tube that lies anterior to the lungs. The trachea is easy to identify because of the cartilaginous rings that help keep it form collapsing as the animal inhales and exhales.
6. Notice that the trachea branches into each lung. These two tubes are called bronchial tubes. Inside the lungs these branch into smaller bronchioles that end with a grape-like cluster of air sacs or alveoli where oxygen and carbon dioxide are exchanged with capillaries.
7. Lying ventral to the trachea or windpipe, locate the pinkish-brown, V-shaped structure called the thyroid gland. This gland secretes hormones that control metabolism.
8. At the top, anterior end of the trachea, find the hard, light-colored larynx or voice box. This organ contains the vocal cords that enable the animal to produce sound.
9. Locate the epiglottis at the top of the trachea. This flap of skin closes over the trachea whenever you swallow. Find the area called the pharynx at the back of the nasal cavity. Air enters an adult pig through the mouth or nose before passing through the pharynx and down the trachea to the lungs.
10. Label the diagram of the respiratory system on your hand-in.

11. Clean up your materials and work area Place your pig in a ziplock bag, wash and dry your tray and tools. And put them back on the supply bench. Thoroughly wash your hands with soap.

Part 4  Circulatory System

1. Be sure to wear your lab apron and eye cover.
2. Locate the heart. It is covered by a thin tissue called the pericardium. Remove this membrane to study the heart.
3. Pigs, like all mammals, have four-chambered hearts. The right side of the heart pumps blood to the lungs, while the left side of the heart pumps blood to all other parts of the body. Locate the right and left sides of the heart.
4. Each side of the heart has an upper and a lower chamber. Upper chambers are called atria and receive blood, while lower chambers are called ventricles and pump blood out of the heart. Locate the right and left atria and ventricle.
5. Notice that the surface of the heart is covered with blood vessels. These are part of the coronary circulation, a set of arteries and veins whose only job is to nourish the heart tissue. Blockage in these vessels causes heart attacks.
6. Anterior to the heart, locate another large vein that enters the right atrium. This vein, the anterior vena cava, brings blood to the right atrium from the anterior part of the body.
7. Now lift the heart to view its dorsal surface. Observe the posterior vena cava that carries blood from the posterior part of the body and empties it into the right atrium.
8. Find the pulmonary artery which leaves the right ventricle. After birth, this vessel carries blood to the lungs. However, in a fetus, a shunt called the ductus arteriosus allows fetal blood to bypass the lungs and go directly to the aorta, the largest artery of the body.
9. Locate the pulmonary veins that enter the left atrium. After birth, these vessels carry oxygenated blood from the lungs to the heart.
10. Identify the aorta, a large artery that transports blood from the left ventricle. Many arteries that carry blood throughout the body branch off of the aorta.

11. Remove the heart by severing the blood vessels attached to it.

12. Hold the dorsal and ventral surfaces of the heart with your thumb and forefinger and rest the ventricles on your dissecting tray. With a scalpel, cut the heart into dorsal and ventral halves. **Caution: The scalpel is very sharp. Use it carefully and always cut away from yourself.**

13. Remove any material inside the heart and expose the walls of the atria and the ventricles.

14. Study the internal features of these chambers and note where vessels leave or enter each chamber. Locate the valves between each atrium and ventricle. These structures prevent blood from flowing backward in the heart.

15. Label the fetal pig heart diagram on your hand-in.

16. Clean up your materials and work area. Place your pig in a ziplock bag, wash and dry your tray and tools. And put them back on the supply bench. Thoroughly wash your hands with soap.

**Part 5  Urogenital System**

1. Be sure to wear your lab apron and eye cover.

2. Remove the digestive organs to study the excretory and reproductive organs that make up the **urogenital system.**

3. Locate the large, bean-shaped **kidneys** lying against the dorsal body wall. Notice that they are covered by the **peritoneum.** Kidneys filter wastes from blood.

4. Find the **ureters,** tubes which extend from the kidneys to the bag-like **urinary bladder.** The urinary bladder lies between the **umbilical arteries** and temporarily stores liquid wastes filtered from the blood.

5. Lift the urinary bladder to find the **urethra,** the tube which carries urine out of the body. Follow the urethra to the urogenital opening on the outside of the pig's body.

6. Make sure that the incision extends all the way but be careful not to cut too deep and damage the internal organs.

7. Follow the directions below for locating the excretory and reproductive organs in either a male or female pig. When you finish observing the organs in a pig of one sex, exchange specimens with another classmate to view the organs in a pig of the opposite sex.

**Male System**

1. In the male pig, locate the two **scrotal sacs** at the posterior end of the pig. If the pig is in the later stages of development, you will find a **testis** in each sac. If the pig is in an early stage of development, the oval-shaped testes will be in the abdominal cavity. These testes have not yet descended into the scrotal sacs.

2. On each testis, find the coiled **epididymis.** Sperm cells produced in the testis pass through the epididymis and into a tube called the **vas deferens.** This tube crosses over a ureter and enters the urethra.

3. Follow the urethra to the **penis,** a muscular tube lying just below the skin posterior to the umbilical cord. In mammals, the penis is the organ that transfers sperm.

4. Label the diagram of the male urogenital system on your hand-in.

**Female System**

1. In the female pig, find the two bean-shaped **ovaries** at the posterior end of the abdominal cavity. Observe the coiled **Fallopian tube** attached to each ovary, which carries eggs from the ovary.

2. Follow the Fallopian tube to the **uterus.** The uterus is dorsal to the urinary bladder and the urethra.

3. Trace the uterus to a muscular tube called the **vagina.** The vagina will appear as a continuation of the uterus. Sperm from the male are deposited into this organ during mating. The vagina and the urethra open into a common area called the **urogenital sinus.** This cavity opens to the outside at the urogenital opening.

4. Label the diagram of the female urogenital system on your hand-in.
5. When you have completed your study of the urogenital system of both sexes, then clean up your materials and work area. Place your pig in a ziplock bag, wash and dry your tray and tools. And put them back on the supply bench. Thoroughly wash your hands with soap.

**Part 1  FETAL PIG DISSECTION**

1. How long (metric) is your fetal pig?  
2. What is the age of your fetal pig?  
3. What is the sex of your fetal pig?  

*Label Figure 1 Figure 2 and Fig 3:*
Part 2 – FETAL PIG DISSECTION

Label the following diagram:
Part 3  FETAL PIG DISSECTION

***Be sure to observe a pig of both genders.

Label the parts of these two diagrams.

Hand in all of your worksheets when you have disposed of your fetal pig and cleaned up all of your instruments.
